

PHASE 6 – PROJECT DEVELOPMENT

6.3 PROJECT TESTING

6.3.1 Introduction

Project Testing is an important stage in the development of the project. It is performed to verify whether all the components of the automated standard laptop procurement system are working correctly according to the project requirements.

In this project, testing is carried out on the ServiceNow request process and the Flow Designer automation. The complete workflow is tested from the submission of a laptop request to approval, task creation, task assignment, status update, and completion.

6.3.2 Objective of Project Testing

The main objective of Project Testing is to identify errors and verify that the complete automated workflow functions correctly.

The main objectives are:

1. To verify that employees can submit standard laptop requests.
2. To check whether the required request information is captured correctly.
3. To verify that Flow Designer is triggered after request submission.
4. To test the approval process.
5. To verify automatic task creation.
6. To check whether tasks are assigned to the appropriate team.
7. To verify request status updates.
8. To test system notifications.
9. To identify and correct workflow errors.
10. To verify the complete laptop procurement process.

6.3.3 Testing Process

The testing process begins by submitting a standard laptop request in ServiceNow. The request information is checked to ensure that the required details are stored correctly.

After submission, the Flow Designer workflow is monitored to verify that the automation starts correctly. The approval stage is then tested to ensure that the request moves to the next stage after the appropriate action.

Once the approval is completed, the system is checked for automatic task creation and assignment. The request status is monitored throughout the process, and notifications are verified.

Finally, the complete workflow is tested from request submission to completion to ensure that all components work together correctly.

6.3.4 Functional Testing

Functional Testing verifies whether each feature performs according to the defined requirements.

The following functions are tested:

Laptop Request Submission:

The employee should be able to submit a standard laptop request successfully.

Request Record Creation:

The submitted information should be stored correctly in ServiceNow.

Flow Trigger:

The Flow Designer flow should start automatically when the required request condition is satisfied.

Approval:

The request should be sent to the appropriate approver.

Task Creation:

After the required approval, the system should automatically create the procurement or IT task.

Task Assignment:

The created task should be assigned to the appropriate responsible team or user.

Status Update:

The request status should change correctly according to the workflow.

Notifications:

Required notifications should be generated during important stages of the process.

Request Completion:

The request should reach the completed stage after the procurement process is finished.

6.3.5 Integration Testing

Integration Testing verifies whether the different components of the project work together correctly.

In this project, the following integration is tested:

ServiceNow Service Catalog → Laptop Request → Flow Designer → Approval → Task Creation → Task Assignment → Status Update → Notification → Completion

The purpose is to ensure that information is transferred correctly between the different stages and that one workflow activity properly triggers the next activity.

6.3.6 Error Identification and Correction

During testing, errors may be identified in the request form, Flow Designer conditions, approval configuration, task assignment, notifications, or status updates.

When an error is found, the related configuration is reviewed and corrected. The workflow is then executed again to confirm that the issue has been resolved.

This process helps improve the reliability and accuracy of the automated procurement system.

6.3.7 Test Completion

Testing is considered successful when the complete laptop procurement workflow operates as expected without major errors.

The final verification includes:

- Successful laptop request submission
- Correct request record creation
- Successful Flow Designer execution
- Correct approval processing
- Automatic task creation
- Correct task assignment
- Proper status updates
- Successful notification generation
- Successful request completion

6.3.8 Expected Outcome

The expected outcome of Project Testing is a properly functioning automated standard laptop procurement system.

The testing ensures that ServiceNow and Flow Designer work together to reduce manual processing and provide a consistent workflow for handling standard laptop requests.

6.3.9 Conclusion

Project Testing verifies the overall functionality and reliability of the developed system. By testing each major component and the complete workflow, errors can be identified and corrected before the final implementation.

The successful completion of testing confirms that the **Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer** project performs the required procurement automation process as intended.
