

PHASE 6-PROJECT TESTING PHASE

The project testing phase is carried out to verify that the automated standard laptop procurement workflow functions correctly and efficiently in the ServiceNow environment. Each module of the workflow is tested individually and then the complete process is tested from request submission to completion.

Module 1: Laptop Request Submission

The testing begins with submitting a standard laptop request through the ServiceNow Service Catalog. The employee enters the required information and submits the request.

The system is checked to verify that the request is accepted successfully without errors. The entered information is also verified to ensure that the required details are captured correctly.

Module 2: Request Record Creation and Verification

After submitting the request, the corresponding request record is verified in ServiceNow. The request number, employee details, laptop information, and other required fields are checked.

This module ensures that the submitted information is stored correctly and can be accessed for further processing.

Module 3: Flow Designer Trigger

The Flow Designer workflow is tested to verify that it starts automatically when the standard laptop request satisfies the defined trigger conditions.

The flow execution is monitored to ensure that the configured actions are executed in the correct sequence without unnecessary errors or interruptions.

Module 4: Approval Process

The approval stage is tested to ensure that the laptop request is sent to the appropriate approver.

The approval response is verified to confirm that an approved request proceeds to the next stage of the workflow. The system behaviour for the approval process is also checked to ensure that the workflow follows the configured conditions.

Module 5: Automatic Task Creation

After the required approval, the system is tested to verify that an IT or procurement task is created automatically.

The generated task is checked to ensure that the task contains the required request information and is linked to the appropriate laptop procurement request.

Module 6: Task Assignment

The task assignment process is tested to verify that the automatically created task is assigned to the appropriate IT or procurement team or user.

This module ensures that the responsible person or team can identify and process the laptop procurement task without requiring unnecessary manual assignment.

Module 7: Procurement Processing

The procurement processing stage is tested to verify that the assigned team can process the standard laptop order.

The progress of the request is monitored to ensure that the procurement activity is properly connected with the original request and that the required information is available throughout the process.

Module 8: Status Update

The request status is checked during different stages of the workflow. The system is verified to ensure that status information is updated according to the progress of the laptop procurement process.

This provides better visibility of the request and allows the employee and responsible team to understand the current stage of processing.

Module 9: Notification Testing

The notification process is tested to verify that important updates are communicated to the employee and responsible team.

Notifications related to request processing, approval, task progress, or completion are checked to ensure that the configured communication process works correctly.

Module 10: Request Completion

The final stage of testing verifies that the laptop request reaches the completed state after all required procurement activities are finished.

The complete request record is reviewed to ensure that the required information, task details, status, and other workflow activities have been processed correctly.

Module 11: End-to-End Workflow Testing

The complete workflow is tested as a single process, starting from the submission of the standard laptop request and continuing through request creation, Flow Designer execution, approval, task creation, task assignment, procurement processing, status updates, notifications, and final completion.

This testing confirms that the different modules work together correctly and that information is passed properly between each stage.

Module 12: Error Identification and Correction

During testing, any configuration errors, workflow issues, approval problems, task assignment issues, or notification failures are identified.

The identified issues are corrected by reviewing the ServiceNow configuration and Flow Designer settings. The affected module is then tested again to confirm that the issue has been resolved.

Testing Outcome

The testing phase verifies the functionality and reliability of the automated standard laptop procurement workflow. The major modules are tested individually as well as through the complete end-to-end process.

The testing confirms the proper functioning of request submission, request creation, Flow Designer automation, approval, automatic task creation, task assignment, procurement processing, status updates, notifications, and request completion. The final workflow provides a structured and automated approach for processing standard laptop procurement requests in ServiceNow.
