

PHASE 2 – REQUIREMENT ANALYSIS

MODULE 2.4 – TECHNOLOGY STACK

2.4.1 Introduction

The Technology Stack describes the technologies and ServiceNow components used to develop the automated IT procurement solution. The project primarily uses the ServiceNow platform and its workflow automation capabilities.

2.4.2 ServiceNow

ServiceNow is the primary platform used for implementing the project.

It provides the environment required to create service requests, manage records, configure workflows, assign tasks, and track request progress.

2.4.2 Service Catalog

The Service Catalog provides the interface through which employees can request a standard laptop.

It can contain the required fields and information needed to process the laptop request.

Main Purpose

- Provide a user-friendly request form.
- Capture employee and laptop information.
- Submit requests into the ServiceNow system.

2.4.4 Flow Designer

Flow Designer is the core automation technology used in this project.

It allows the procurement process to be automated using triggers, actions, conditions, approvals, and tasks.

Example Flow

Create/Assign Procurement Task

Update Status

Send Notification

2.4.5 ServiceNow Tables

ServiceNow tables are used to store and manage information related to requests and tasks.

They provide centralized storage for:

- Request details
- Employee information
- Approval information
- Task details
- Request status

2.4.6 Notifications

ServiceNow notifications can be used to inform employees and teams about important changes in the request.

Examples include:

- Request submitted.
- Request approved.
- Request rejected.
- Procurement task created.
- Request completed.

2.4.7 User Roles and Access

ServiceNow roles and permissions help control access to procurement information.

Different users can have different responsibilities, such as:

- Employee – Submit and track requests.
- Approver – Review and approve requests.
- IT/Procurement Team – Process approved requests.
- Administrator – Configure and maintain the system.

2.4.8 Technology Stack Summary

Technology / Component	Purpose
ServiceNow	Main application platform
Service Catalog	Laptop request submission
Flow Designer	Workflow automation
ServiceNow Tables	Data storage and record management

Notifications	Request and workflow updates
Roles & Permissions	Access control
ServiceNow UI	User interaction and request tracking

2.4.9 System Architecture

2.4.10 Conclusion

The selected technology stack provides the required components to implement the automated laptop procurement system. ServiceNow provides the overall platform, while Service Catalog handles request submission and Flow Designer manages the automation. Together, these components support a structured and efficient IT procurement workflow.
