

PHASE 4 – PROJECT DESIGN

MODULE 4.2 – PROPOSED SOLUTION

4.2.1 Introduction

The proposed solution is designed to automate the standard laptop procurement process using the ServiceNow platform and Flow Designer.

The system provides a structured workflow that starts when an employee submits a laptop request and continues through approval, task assignment, procurement processing, and completion.

4.2.2 Overview of the Proposed Solution

In the proposed system, employees submit a standard laptop request through ServiceNow. The request contains the required information for processing the order.

Once the request is submitted, Flow Designer automatically starts the defined workflow. The workflow manages the subsequent activities based on the configured conditions and actions.

The basic process is:

Employee Laptop Request Approval Flow Designer Task Assignment
Procurement Processing Fulfilment Completion

4.2.3 Main Components

The proposed solution consists of the following components:

1. Employee Request

The employee submits a standard laptop request through ServiceNow. Required information is captured in the request record.

2. ServiceNow Request Management

ServiceNow stores the request and provides a centralized location for managing the procurement information.

3. Flow Designer

Flow Designer controls the automated workflow. It performs predefined actions based on the request and its current status.

4. Approval Process

The request is sent through the required approval stage before further processing.

5. Task Creation and Assignment

After the required approval, the workflow can create a task for the responsible IT or procurement team and assign the work appropriately.

6. Procurement Processing

The responsible team processes the laptop order based on the approved request.

7. Status Updates

The request status is updated as the process moves through different stages.

8. Notifications

Notifications can be used to inform the employee about important changes, such as submission, approval, processing, or completion.

4.2.4 Proposed Workflow

The complete proposed workflow can be represented as:

Step 1: Employee identifies the need for a standard laptop.

Step 2: Employee submits the laptop request in ServiceNow.

Step 3: The request is stored in the ServiceNow system.

Step 4: Flow Designer is triggered.

Step 5: The request goes through the required approval process.

Step 6: After approval, a task is created for the responsible team.

Step 7: The IT/procurement team processes the request.

Step 8: The request status is updated.

Step 9: The employee receives relevant notification or status information.

Step 10: The request is completed after fulfilment.

4.2.5 Key Features

The proposed solution provides:

- Standardized laptop request submission.
- Automated workflow execution.
- Approval management.
- Automated task creation.
- Task assignment.
- Request status tracking.
- Automated notifications.
- Centralized request management.
- Reduced manual processing.

4.2.6 Benefits of the Proposed Solution

The proposed system can provide the following benefits:

Improved Efficiency:

Automation reduces repetitive manual activities.

Better Tracking:

Employees and responsible teams can view the progress of requests.

Faster Processing:

Automated workflow steps can reduce unnecessary waiting between activities.

Better Communication:

Notifications provide updates at important stages.

Consistency:

A predefined workflow helps process similar laptop requests in a structured manner.

Centralized Management:

Request information and workflow activities are managed within ServiceNow.

4.2.7 Conclusion

The proposed solution provides an automated and structured approach to standard laptop procurement. By combining ServiceNow request management with Flow Designer, the project creates a workflow that manages requests from submission through completion.

The solution is designed to reduce manual effort, improve visibility, and provide a more organized procurement process.
