

PHASE 6 – PROJECT DEVELOPMENT

6.1 USER ACCEPTANCE

6.1.1 Introduction

User Acceptance Testing (UAT) is an important stage of the project development phase. It is performed to verify whether the developed system meets the requirements and expectations of the intended users. In this project, User Acceptance focuses on checking whether the automated standard laptop procurement process works correctly from the employee's point of view.

The project uses ServiceNow and Flow Designer to automate the laptop ordering process. UAT helps confirm that employees can submit a laptop request easily and that the request moves through the required approval, task creation, procurement, and completion stages correctly.

6.1.2 Objective of User Acceptance

The main objective of User Acceptance is to ensure that the developed solution satisfies the defined business and user requirements.

The objectives are:

1. To verify that employees can submit a standard laptop request successfully.
2. To ensure that all required request information is captured correctly.
3. To verify that the Flow Designer workflow is triggered after request submission.
4. To check whether the approval process works correctly.
5. To verify automatic task creation and assignment.
6. To ensure that request status is updated properly.
7. To verify that users receive appropriate notifications.
8. To confirm that the complete procurement process is easy to understand and use.

6.1.3 User Acceptance Process

The User Acceptance process begins by allowing a user to submit a standard laptop request through ServiceNow. The submitted request is checked to ensure that the required information is captured correctly.

After submission, the Flow Designer automation is triggered. The request is then sent through the required approval process. Once the approval is completed, the system automatically creates and assigns the required task to the responsible IT or procurement team.

The user then verifies whether the request status changes correctly during the process. Notifications are also checked to ensure that the user receives important updates. Finally, the request is completed, and the user confirms that the overall process meets the expected requirements.

6.1.4 User Acceptance Activities

The following activities are performed during User Acceptance:

Request Submission:

The user submits a standard laptop request through the ServiceNow system.

Request Verification:

The submitted request is checked to ensure that employee and laptop-related information is recorded correctly.

Workflow Verification:

The user verifies that the Flow Designer workflow starts automatically after the request is submitted.

Approval Verification:

The approval request is checked to ensure that it reaches the appropriate approver.

Task Verification:

After approval, the system should automatically create the required procurement or IT task.

Task Assignment Verification:

The task should be assigned to the appropriate responsible team or user.

Status Verification:

The user checks whether the request status changes correctly throughout the process.

Notification Verification:

Notifications are checked to ensure that important request updates are communicated to the user.

Completion Verification:

The user verifies that the request reaches the completed stage after the laptop

procurement process is finished.

6.1.5 User Acceptance Criteria

The project is considered acceptable when the following conditions are satisfied:

- The employee can submit a laptop request successfully.
- Required request information is captured correctly.
- The Flow Designer flow is triggered automatically.
- Approval is generated correctly.
- Required tasks are created automatically.
- Tasks are assigned to the appropriate team or user.
- Request status is updated correctly.
- Notifications are generated when required.
- The complete workflow can be followed without unnecessary manual intervention.
- The final request can be completed successfully.

6.1.6 User Feedback

User feedback is collected during the acceptance stage to identify usability issues and missing requirements. Users can provide feedback regarding the request form, approval process, status tracking, notifications, and overall workflow.

The feedback can be used to make improvements to the ServiceNow configuration and Flow Designer workflow. Any identified issues are corrected and tested again before final project completion.

6.1.7 Expected Outcome

The expected outcome of User Acceptance is a system that satisfies the defined user requirements and provides a simple and reliable laptop procurement process.

The employee should be able to submit a request and track its progress while the system automatically handles approvals, task creation, assignment, notifications, and status updates.

6.1.8 Conclusion

User Acceptance confirms that the automated laptop procurement system is suitable for its intended users. By verifying the complete workflow from request submission to completion, the project ensures that the ServiceNow and Flow Designer implementation meets the required functional expectations.
